

Used Parts for Forklifts

Used Forklift Parts - In time, lift truck parts would wear and should be replaced. Obtaining new components can become a pricey venture so one more idea is to obtain used forklift parts. This could save much cash in the long run. It is a great idea to acquire used forklift parts that have been remanufactured. These parts would ensure that you are getting components that would work for a long time and be productive.

Broken or worn parts that are remanufactured are a less expensive answer compared to rebuilding. With rebuilding components, only the parts which are broken or worn out get changed, which means that other wearable parts could break down soon after acquisition.

Remanufacturing on the other hand provides the best assurance for second-hand components. Reproduced components are taken apart and cleaned and then all wearable pieces are replaced. All wearable parts are replaced regardless of age or wear which is one more reason why remanufactured parts in general function so much better. Whatever component within the part is brand new and this offers far longer life to the second-hand part. Depending on the lift truck parts which are being redone, the cleaning process and the entire remanufacturing process would vary.

The engines are cleaned after a complete disassembly. Various engine parts like rings, pistons, spark plugs, filters, valves, and valve springs can be replaced during the process of remanufacturing. The engines are hot tested after reassembly to guarantee that there are no leaks, no noises, no oil pressure problems or any vacuum.

Transmissions are another item which is oven cleaned after being disassembled. The transmission is then pressure washed. A thorough inspection is performed in order to check for any cracks. Bearings, bushings and seals are all replaced. Usually, the replacement parts utilized on transmission components meet OEM specifications.

Some forklift components like for example the water pump, torque converters, the alternator, steer axles and the starter could be quite serviceable after worn components are replaced. The electronic control in the electric lift truck is maintained by the control card. This particular card can even be remanufactured with replacing all aged and worn out parts. Unlike several lift truck components the control card can only have the worn and aged components replaced.

Remanufactured components are thoroughly examined upon reassembly to ensure they are in top condition prior to being sold. It is important when acquiring remanufactured parts to be sure they have undergone the proper testing and inspection procedures. On certain larger parts such as engines, transmissions and steer axles, OEM specification replacement components should be used.

The dealer of used lift trucks and parts can ensure that the reproduced components have met OEM specifications and that these parts meet industry standards. A lot of details go into remanufacturing used parts. This attention to detail provides more serviceability out of reproduced components opposed to the parts that were only rebuilt.
